## **BIOLOGICAL ACTIVITY:**

Oxyresveratrol (trans-Oxyresveratrol) is a potent naturally occurring antioxidant and free radical scavenger ( $IC_{50}$  of 28.9 µM against DPPH free radicals). Oxyresveratrol is potent and noncompetitive **tyrosinase** inhibitor with an  $IC_{50}$  value of 1.2 µM for mushroom tyrosinase. Oxyresveratrol is effective against **HSV-1**, **HSV-2** and **varicella-zoster virus**, and has neuroprotective effects<sup>[1][2][3][4]</sup>. IC50 & Target: IC50: 1.2 µM (Mushroom tyrosinase)<sup>[2]</sup>; 28.9 µM (DPPH free radicals)<sup>[1]</sup>; 45.31 µM (NO)<sup>[1]</sup> HSV-1, HSV-2, Varicella-zoster virus<sup>[4]</sup> *In Vitro:* Cultures of the murine microglial cell line N9 and primary mixed glial cultures were used to test the drug effects of NO production upon expression of the inducible isoform of nitric oxide synthase (iNOS). Oxyresveratrol considerably diminished NO (nitrite) levels ( $IC_{50}$  of 45.31 µM) in murine microglial cells<sup>[1]</sup>. Oxyresveratrol can inhibit DOPA oxidase activity, cyclooxygenase, and rat liver mitochondrial ATPase activity. Oxyresveratrol exhibits a dose-dependent inhibitory effect on L-tyrosine oxidation by the murine tyrosinase but does not inhibit the promoter activity of the enzyme gene. Oxyresveratrol exhibits significant inhibitory effects at 10 µM and higher concentrations on murine tyrosinase activity<sup>[2]</sup>. *In Vivo:* Oxyresveratrol (2-30 mg/kg; intraperitoneal injection; twice) treatment reduces the brain infarct volume in MCAO rats<sup>[3]</sup>.
