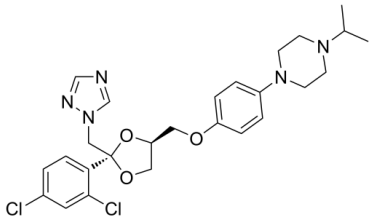
Data Sheet

Product Name:	Terconazole
Cat. No.:	CS-6456
CAS No.:	67915-31-5
Molecular Formula:	$C_{26}H_{31}Cl_2N_5O_3$
Molecular Weight:	532.46
Target:	Fungal
Pathway:	Anti-infection
Solubility:	DMSO : ≥ 30 mg/mL



BIOLOGICAL ACTIVITY:

Terconazole is a broad-spectrum **antifungal** medication for the treatment of vaginal yeast infection. ***In Vitro:*** Terconazole inhibits the growth of ***Candida albicans*** ATCC 44859 in a concentration-related manner, but with modest effects noted at levels from 0.1 to 10 μM when the yeast is grown on media favoring the cell form. The inhibitory potency of terconazole on yeast cell viability varies with the strain and species of Candida tested. The susceptibility of ***C. albicans*** ATCC 44859 to terconazole is markedly enhanced when the yeast is grown on Eagle minimum essential medium, which favors mycelium formation. There is a progression of changes, from loss of mycelia formation at 0.1 μM terconazole through complete necrosis at 100 μM[1]. Terconazole blocks the morphogenetic transformation from the yeast into the filamentous form at concentrations of 0.008 to 0.05 microgram/mL[2]. ***In Vivo:*** A 3-day once-daily intravaginal application of terconazole 0.8% is usually sufficient to provide a functional therapeutic period of 7 days because of prolonged high biologically active antifungal levels in the vagina. No side effects are observed at any concentration of terconazole[2].

PROTOCOL (Extracted from published papers and Only for reference)

Animal Administration: [2]Rats: The rats are infected intravaginally with ***C. albicans***. They are treated topically twice daily for 3 days, starting 24 hours after infection with a volume of 0.2 mL of various concentrations of terconazole (0.125%, 0.25%, 0.4%, 0.5%, 1%, 2%), miconazole, clotrimazole, econazole, nystatin, or amphotericin B[2].
